Nanotechnology and Nanomaterials in Chemical Processes Training Course

14 - 18 Dec 2026

Cape town

4600 € (Per Person)

Ref: #ACE3700_265812

Course Introduction / Overview:

This training course gives a comprehensive look into the core principles of nanotechnology and its transformative applications in chemical processes. As industries seek to enhance efficiency, reduce waste, and develop new materials, understanding and using nanomaterials has become essential. This course gives participants a solid foundation in the synthesis, characterization, and application of various nanomaterials, including carbon nanotubes, graphene, and quantum dots. We will explore their use in catalysis, separations, environmental remediation, and energy storage, highlighting how these materials are revolutionizing chemical engineering. The curriculum is informed by leading academic research in the field. The book Nanomaterials: Synthesis, Properties and Applications by A.S. Edelstein and R.C. Cammarata is a foundational reference. BIG BEN Training Center is committed to giving a forward-thinking curriculum that equips professionals with the skills needed to lead innovation in this rapidly evolving sector. This course is designed to meet the growing demand for expertise in nanotechnology applications in chemical industries.

Target Audience / This training course is suitable for:

- Chemical and process engineers.
- R&D scientists and researchers.
- Materials scientists.
- Environmental engineers.
- Product development specialists.
- Academics and students in related fields.
- Professionals in advanced manufacturing.

Target Sectors and Industries:

- Chemical manufacturing.
- Pharmaceuticals.
- Environmental services and remediation.
- Energy and batteries.
- Advanced materials.
- Government agencies and research institutes.
- Electronics and semiconductors.

Target Organizations Departments:

- Research and development.
- Process engineering.
- Materials science.
- Product innovation.
- Quality control.
- Environmental management.
- Manufacturing and production.

Course Offerings:

By the end of this course, the participants will have able to:

- Describe the fundamental properties of nanomaterials.
- Identify and explain common synthesis methods.
- Use characterization techniques to analyze nanomaterial properties.
- Apply nanomaterials in catalytic processes to improve reaction efficiency.
- Evaluate the use of nanofiltration for water and air purification.
- Design and model nanostructured materials for specific applications.
- Assess the health, safety, and environmental implications of nanotechnology.
- Stay up to date with emerging trends in nanomaterials for chemical engineering.

Course Methodology:

This training course uses a blend of theoretical instruction, guided exercises, and hands-on projects to give a dynamic learning experience. The curriculum combines theoretical lectures with real-world case studies to bridge the gap between academic concepts and practical application. Participants will use hands-on activities, including group workshops and scenario-based exercises, to reinforce their understanding of key topics. We use discussions and Q&A sessions to encourage a collaborative learning environment, where participants can share experiences and insights. The course also includes an in-depth analysis of successful and unsuccessful projects from various industries to highlight best practices and common pitfalls. This approach gives participants the confidence to apply their new knowledge directly to their professional roles. At BIG BEN Training Center, we believe that an engaging and interactive format is key to mastering new skills, so we focus on giving immediate feedback and continuous support throughout the training. The methods are designed to ensure every participant leaf with a clear, practical skill set.

Course Agenda (Course Units):

Unit One: Fundamentals of Nanomaterials.

- Introduction to nanoscience and nanotechnology.
- Unique properties of materials at the nanoscale.
- Types of nanomaterials: 0D, 1D, 2D, and 3D.
- Synthesis methods: top-down and bottom-up.
- Characterization techniques for nanomaterials.

Unit Two: Nanomaterials in Catalysis.

- Introduction to Nano catalysis.
- Advantages of using Nano catalysts.
- Design of catalytic nanoparticles.
- Case studies in heterogeneous and homogeneous nano catalysis.
- Photocatalysis and electrocatalysis using nanomaterials.

Unit Three: Nanomaterials for Separation Processes.

- Membrane technologies using nanomaterials.
- Adsorption and absorption with nanostructured materials.
- Nanofiltration for water and wastewater treatment.
- Graphene and carbon nanotube membranes.
- Case studies in industrial separations.

Unit Four: Nanomaterials in Environmental and Energy Applications.

- Nanomaterials for environmental remediation.
- Air and soil purification using nanostructures.
- Nanomaterials in energy storage devices.
- Nanotechnology for enhanced solar cells.
- Safety and environmental impact of nanomaterials.

Unit Five: Emerging Trends and Future of Nanotechnology.

- Quantum dots and their applications.
- Nanomaterials in sensors and detectors.
- Advanced manufacturing techniques for nanomaterials.
- Ethical considerations and regulations in nanotechnology.
- Future outlook for nanomaterials in chemical processes.

FAQ:

Qualifications required for registering to this course?

There are no requirements.

How long is each daily session, and what is the total number of training hours for the course?

This training course spans five days, with daily sessions ranging between 4 to 5 hours, including breaks and interactive activities, bringing the total duration to 20 - 25 training hours.

Something to think about:

What ethical and regulatory challenges must be addressed for the safe and widespread commercial use of nanomaterials, particularly in products with direct human and environmental exposure?

What unique qualities does this course offer compared to other courses?

This training course stands out because it focuses specifically on the practical and industrial applications of nanomaterials within chemical processes. While many courses give a broad overview of nanotechnology, our curriculum is tailored to the needs of chemical engineers and scientists who want to apply this technology to solve real-world problems. We don't just teach you about science; we help you understand how to design and integrate these materials into existing industrial workflows. The content is heavily focused on case studies from various sectors, giving participants clear examples of how nanomaterials are being used today. This course also puts a lot of weight on the safety and environmental aspects of nanotechnology, which is a critical topic in this field. It’s an advanced program that gives professionals the skills to use nanotechnology as a powerful tool for innovation and process improvement.
