Advanced Radioactive Waste Management and Safety Protocols Training Course

25 - 29 Oct 2026

Amman

3800 € (Per Person)

Ref: #ENV4336_226144

Course Introduction / Overview:

The management of radioactive waste is one of the most critical challenges facing the nuclear industry, medical sector, and research institutions today. Ensuring the safe handling, treatment, storage, and disposal of these materials is paramount to protecting human health and the environment for generations to come. This comprehensive course provides a deep dive into the entire lifecycle of radioactive waste management, from generation to final disposal. Grounded in international best practices and regulatory standards, the curriculum explores both the scientific principles and the practical applications of safety protocols. As discussed by leading experts like Michael I. Ojovan in his work "An Introduction to Nuclear Waste Immobilisation," a successful management strategy requires a multidisciplinary approach, integrating physics, chemistry, geology, and engineering. BIG BEN Training Center has designed this program to equip participants with the advanced knowledge and skills needed to develop and implement robust, compliant, and effective waste management programs. This training moves beyond theoretical concepts to address real-world scenarios, ensuring that professionals can confidently navigate the complexities of waste characterization, containment, and long-term stewardship in a highly regulated environment.

Target Audience / This training course is suitable for:

- Radiation Safety Officers (RSOs).
- Nuclear Engineers and Technicians.
- Environmental Health and Safety (EHS) Managers.
- Waste Management Specialists and Coordinators.
- Regulatory Affairs and Compliance Officers.
- Hazardous Materials (HazMat) Team Members.
- Medical Physicists and Radiologists.
- Decommissioning and Remediation Project Managers.
- Governmental Regulators and Policy Makers.
- Research Scientists and Laboratory Managers.

Target Sectors and Industries:

- Nuclear Power Generation and Utilities.
- Medical and Healthcare Facilities (Hospitals, Clinics).
- Pharmaceutical and Biotechnology Research.
- Academic and Scientific Research Institutions.
- Governmental and Military Nuclear Programs.
- Radioactive Waste Treatment and Disposal Facilities.
- Environmental Consulting and Engineering Firms.
- Nuclear Fuel Cycle and Reprocessing Plants.
- Decommissioning and Environmental Remediation Companies.
- Transportation and Logistics for Hazardous Materials.

Target Organizations Departments:

- Environmental, Health, and Safety (EHS).
- Operations and Facility Management.
- Regulatory Compliance and Legal Affairs.
- Engineering and Technical Services.
- Radiation Protection and Control.
- Research and Development (R&D).
- Waste Management and Disposal Operations.
- Emergency Response and Preparedness.
- Project Management (Decommissioning Projects).
- Quality Assurance and Quality Control (QA/QC).

Course Offerings:

By the end of this course, the participants will have able to:

- Develop a comprehensive radioactive waste management plan based on waste stream characteristics.
- Implement and enforce radiation safety protocols in compliance with international standards.
- Classify and characterize different types of radioactive waste accurately.
- Evaluate various waste treatment, conditioning, and volume reduction technologies.
- Design safe and compliant procedures for the packaging, labeling, and transportation of radioactive materials.
- Analyze the principles and challenges of short-term storage and long-term disposal.
- Conduct risk assessments and develop emergency response plans for radiological incidents.
- Navigate complex national and international regulatory frameworks, including IAEA and NRC standards.
- Promote a strong safety culture within their organizations to minimize human error.
- Understand the key stages and safety considerations in nuclear facility decommissioning.

Course Methodology:

The training methodology at BIG BEN Training Center is designed to foster a deep and practical understanding of radioactive waste management. We employ a blended learning approach that combines expert-led instruction with highly interactive and participatory sessions. The course moves beyond traditional lectures to immerse participants in real-world challenges through the extensive use of case studies drawn from international incidents and successful management projects. Group discussions and collaborative workshops will encourage participants to share experiences and problem-solve complex scenarios, such as designing a waste segregation plan or a transport security protocol. Practical exercises will be a core component, allowing attendees to apply theoretical knowledge to tasks like completing regulatory paperwork or developing a preliminary site decommissioning safety assessment. Our instructors facilitate a dynamic learning environment where feedback is continuous and constructive. This hands-on, engaging methodology ensures that participants not only learn the principles of radioactive waste safety but also gain the confidence and competence to apply them effectively in their professional roles, ensuring a lasting impact on their organization's safety and compliance performance.

Course Agenda (Course Units):

Unit One: Fundamentals of Radioactivity and Waste Management

- Introduction to Atomic and Nuclear Physics.
- Sources and Types of Ionizing Radiation.
- Principles of Radiation Protection and the ALARA Concept.
- Classification of Radioactive Waste (LLW, ILW, HLW).
- The Nuclear Fuel Cycle and Waste Generation Streams.

Units of Radioactivity and Radiation Dose Measurement.

- Health Effects of Ionizing Radiation Exposure.

Unit Two: Regulatory Frameworks and Compliance

- Overview of International Standards (IAEA Safety Standards).
- Analysis of National Regulatory Bodies and Legislation (e.g., NRC, EPA).
- Licensing Requirements for Facilities Handling Radioactive Materials.
- Documentation, Record-Keeping, and Reporting Mandates.
- Transportation Regulations for Radioactive Materials.
- Principles of Environmental Impact Assessments.
- Compliance Audits and Regulatory Inspections.

Unit Three: Waste Characterization, Treatment, and Conditioning

- Radiological and Physicochemical Characterization Techniques.
- Waste Segregation, Collection, and Minimization Strategies.
- Liquid Waste Treatment Methods (e.g., Ion Exchange, Evaporation).
- Solid Waste Treatment (e.g., Compaction, Incineration).
- Conditioning and Immobilization Technologies (Cementation, Vitrification).
- Selection Criteria for Appropriate Treatment and Conditioning Processes.
- Quality Assurance for Waste Packages.

Unit Four: Packaging, Storage, Transportation, and Disposal

- Design and Certification of Waste Packages (e.g., Type A, Type B).
- Labeling, Marking, and Placarding Requirements.
- On-site and Interim Storage Facility Design and Operation.
- Security and Safeguards during Storage and Transport.
- Concepts for Near-Surface Disposal of Low-Level Waste.
- Deep Geological Repositories for High-Level Waste and Spent Fuel.
- Long-Term Safety Cases and Performance Assessment for Disposal Sites.

Unit Five: Advanced Safety Management and Future Challenges

- Developing and Implementing a Strong Safety Culture.
- Human Factors and Performance in Nuclear Environments.
- Emergency Preparedness and Response for Radiological Incidents.
- Decontamination and Decommissioning of Nuclear Facilities.
- Site Remediation and Legacy Waste Management.
- Public Communication and Stakeholder Engagement Strategies.
- Innovations and Future Trends in Waste Management Technology.

FAQ:

Qualifications required for registering to this course?

There are no requirements.

How long is each daily session, and what is the total number of training hours for the course?

This training course spans five days, with daily sessions ranging between 4 to 5 hours, including breaks and interactive activities, bringing the total duration to 20 - 25 training hours.

Something to think about:

Considering the multi-generational timescale of high-level radioactive waste, how can we ensure the continuity of knowledge and institutional control to protect future civilizations that may not understand our languages or symbols?

What unique qualities does this course offer compared to other courses?

This course distinguishes itself by offering a holistic, lifecycle-based perspective on radioactive waste management that seamlessly integrates technical science, regulatory compliance, and organizational safety culture. While many programs focus narrowly on procedural compliance, this training delves into the underlying principles, empowering participants to make informed, risk-based decisions in novel situations. We place a significant emphasis on future-facing challenges, with dedicated modules on facility decommissioning and long-term stewardship, topics often overlooked in standard training. The curriculum is built around a practical, problem-solving framework, utilizing case studies of both successes and failures from the global nuclear industry to provide invaluable, real-world lessons. Rather than simply presenting information, our methodology forces participants to analyze complex scenarios, evaluate competing technologies, and develop comprehensive management strategies. This focus on critical thinking and strategic planning, combined with an understanding of the human and organizational factors that underpin safety, provides a level of depth and practical applicability that is exceptionally rare, preparing leaders to manage not just the waste of today, but the legacy of tomorrow.
