Comprehensive Commissioning and Start-Up of Electrical Systems Training Course

19 - 23 Oct 2026

Rome

5800 € (Per Person)

Ref: #ERE4326_57214

Course Introduction / Overview:

Commissioning electrical equipment and power systems is a critical phase for any project. It ensures that all components function correctly and safely before the system is energized, providing a baseline for future maintenance. This intensive training course, presented by BIG BEN Training Center, offers a deep dive into the principles, methodologies, and best practices for testing, commissioning, and starting up electrical equipment. It goes beyond theoretical knowledge, emphasizing a practical approach to preparing systems for operational readiness. Drawing on established industry standards and academic frameworks, the course provides a robust understanding of the entire commissioning lifecycle. Participants will learn how to identify potential hazards, interpret complex electrical drawings, and execute a flawless start-up sequence. The curriculum is informed by the authoritative work of academics like Keith Harker, author of "Power System Commissioning and Maintenance Practice," which provides a foundation for the essential procedures and management practices covered here. This training is designed to build confidence in managing and troubleshooting complex electrical systems, minimizing downtime, and ensuring long-term reliability and safety.

Target Audience / This training course is suitable for:

- Electrical engineers, technicians, and supervisors.
- Maintenance and operations personnel in power generation and distribution.
- Project managers overseeing electrical installation projects.
- Commissioning specialists and consultants.
- Safety and quality assurance professionals.
- Individuals involved in the design and testing of electrical systems.

Target Sectors and Industries:

- Oil and gas.
- Power generation and utility companies.
- Manufacturing and industrial plants.
- Construction and engineering firms.
- Renewable energy (solar, wind).
- Government agencies and equivalents.
- Mining and metallurgy.

Target Organizations Departments:

- Engineering and technical departments.
- Maintenance and reliability teams.
- Operations and plant management.
- Project and construction management.
- Health, safety, and environment (HSE).
- Quality assurance and control.

Course Offerings:

By the end of this course, the participants will have able to:

- Plan and manage the entire commissioning and start-up process for electrical equipment.
- Apply industry-specific safety standards and regulations during testing.
- Perform a variety of pre-commissioning and commissioning tests on different electrical components.
- Diagnoses and troubleshoot common faults and operational issues.
- Interpret complex single-line diagrams, schematics, and wiring schedules.
- Use advanced testing equipment, such as megohmmeters and primary injection testers.
- Develop comprehensive commissioning reports and documentation.
- Ensure compliance with international standards for electrical system safety and performance.

Course Methodology:

This training course uses a dynamic and highly interactive methodology designed to ensure participants gain practical, hands-on skills in electrical commissioning. The approach moves beyond traditional lectures to include a mix of theoretical discussions, real-world case studies, and practical exercises. Each unit incorporates group activities where participants can work together to solve complex problems, simulating actual on-site commissioning scenarios. BIG BEN Training Center's trainers, who are experts in the field, use practical examples from various industrial settings to illustrate key concepts. The course also includes sessions dedicated to the use of specialized testing equipment, allowing participants to become familiar with the tools of trade. Feedback is a core part of the learning process, with trainers providing detailed input to help each participant master the material. This comprehensive methodology ensures a deep understanding of commissioning procedures, effective fault diagnosis, and safe operational practices.

Course Agenda (Course Units):

Unit One: Fundamentals of Electrical Commissioning and Safety

- Introduction to the electrical commissioning lifecycle.
- Key roles, responsibilities, and project stages.
- Safety protocols and risk assessment in power systems.
- Interpreting electrical schematics and documentation.
- Overview of pre-commissioning and start-up procedures.
- Developing a site-specific safety plan.
- Lockout and tag-out procedures.

Unit Two: Testing and Commissioning of Transformers and Switchgear

- Insulation resistance and ratio testing.
- Power factor and winding resistance tests.
- Testing of medium and low-voltage switchgear.
- Circuit breaker functional tests and contact resistance.
- Substation commissioning procedures.
- Understanding transformer oil analysis.
- Introduction to primary and secondary injection testing.

Unit Three: Commissioning of Power Cables and Motor Control Centers

- Cable testing: Hi-pot, VLF, and surge testing.
- Grounding system and earth resistance tests.
- Testing of motor control centers (MCCs).
- Variable frequency drive (VFD) commissioning.
- Troubleshooting cable and insulation faults.
- Visual inspections and mechanical checks.
- Protective relay testing.

Unit Four: Commissioning of Generators and Uninterruptible Power Supplies (UPS)

- Diesel generator start-up and synchronization.
- Testing of automatic transfer switches (ATS).
- Commissioning of uninterruptible power supply (UPS) systems.
- Battery charger testing and maintenance.
- Load bank testing and performance verification.
- Failure modes and root cause analysis.
- System functional performance testing.

Unit Five: Final System Start-Up and Documentation

- Developing a comprehensive start-up plan.
- First, energization procedures and safety measures.
- Post-commissioning activities and handover protocols.
- Creating an effective commissioning report.
- Baseline data collection for future maintenance.
- Review of industry standards (NETA, IEC, ANSI).
- Case studies of successful and challenging projects.

FAQ:

Qualifications required for registering to this course?

There are no requirements.

How long is each daily session, and what is the total number of training hours for the course?

This training course spans five days, with daily sessions ranging between 4 to 5 hours, including breaks and interactive activities, bringing the total duration to 20 - 25 training hours.

Something to think about:

What unique qualities does this course offer compared to other courses?

Something to think about:

In an increasingly automated world, how does a deep, hands-on understanding of electrical equipment commissioning remain critical for ensuring system reliability and safety, especially when modern power systems are so complex?

What unique qualities does this course offer compared to other courses?

This training course stands out by providing a uniquely practical and comprehensive approach to the essential subject of electrical commissioning. While many courses focus on theory, ours is structured around real-world application, ensuring participants not only understand the "what" but also the "how" of each procedure. The curriculum is meticulously designed to mirror the actual phases of a project, from initial safety assessments to the final energization and documentation. We use advanced, hands-on exercises and case studies that simulate the challenges encountered on-site, providing a true-to-life learning experience. Participants will work with modern testing equipment and learn to interpret complex documentation, building a skillset that is immediately applicable in their professional lives. This is a crucial distinction, as it provides a tangible return on investment for both the individual and their organization. The course also goes into specific equipment types, from transformers to UPS systems, ensuring a broad and detailed understanding that is often missing from more general training.
