Optimizing Optical Transport Networks (OTN) and DWDM Training Course

19 - 23 Oct 2026

Rome

5800 € (Per Person)

Ref: #TEL3049_62398

Course Introduction / Overview:

This training course is designed to equip telecom engineers, network architects, and IT professionals with the strategic and technical skills needed to design, implement, and optimize Optical Transport Networks (OTN) and Dense Wavelength Division Multiplexing (DWDM). As the backbone of modern telecommunications, OTN and DWDM are essential for meeting the explosive demand for high-speed data. This program, offered by BIG BEN Training Center, provides a comprehensive framework for understanding the core principles of optical networking, from fiber optic cables and signal multiplexing to network design and performance monitoring. We will explore key concepts such as wavelength management, link budget calculations, and network protection schemes. The curriculum is informed by the academic work of authors like Govind P. Agrawal, whose book, Fiber-Optic Communication Systems, provides a foundational and detailed understanding of the physics and engineering behind optical transport. This course goes beyond a simple overview of technology to provide a deep understanding of how to implement real-world solutions that ensure network reliability, scalability, and efficiency. We prepare participants to be leaders who can build more resilient and high-performing optical networks.

Target Audience / This training course is suitable for:

- Optical network engineers.
- Network architects.
- Telecommunications technicians.
- Field operations personnel.
- Fiber optic specialists.
- System integration specialists.
- IT professionals.
- Government agencies and equivalents.

Target Sectors and Industries:

- Telecommunications.
- Mobile Network Operators (MNOs).
- Internet Service Providers (ISPs).
- Corporate IT Departments.
- Data Center Operators.
- Broadcast and Media.
- Defense.
- Government and public administration agencies.

Target Organizations Departments:

- Network Engineering.
- Network Planning and Optimization.
- Transport Network Operations.
- IT Infrastructure.
- Strategic Planning.
- Field Operations.
- Research and Development (R&D).
- Data Center Operations.

Course Offerings:

By the end of this course, the participants will have able to:

- Understand the fundamental principles of DWDM and OTN.
- Design and plan a fiber optic network.
- Perform link budget calculations.
- Manage and optimize wavelength allocation.
- Implement network protection and restoration.
- Troubleshoot optical network issues.
- Ensure network reliability and performance.
- Leverage optical networks for high-speed data.

Course Methodology:

This training course uses a highly practical and hands-on methodology. The program is built on real-world scenarios and simulations of optical network design and troubleshooting. Participants will work in a simulated planning environment to practice link budget calculations and network design. We will use interactive workshops to deep dive into specific topics, from fiber splicing to performance monitoring. The curriculum is designed to be a collaborative experience where participants can share their unique challenges and innovative solutions. Our trainers, with extensive experience in the field, will provide direct feedback and guidance throughout the course. BIG BEN Training Center is committed to providing a dynamic and practical learning environment, ensuring that participants leave with the skills and confidence to effectively manage optical transport networks.

Course Agenda (Course Units):

Unit One: Foundations of Optical Transport

- The role of optical networks in modern telecoms.
- Introduction to fiber optic technology.
- Principles of Wavelength Division Multiplexing (WDM).
- DWDM vs. CWDM.
- The Optical Transport Network (OTN) protocol.
- OTN framing and features.
- Key components: transponders, muxponders.

Unit Two: DWDM and OTN System Design

- Network topologies and their applications.
- Link budget analysis.
- Fiber characterization.
- Network planning tools.
- Wavelength assignment.
- Network capacity planning.
- Case studies in DWDM network design.

Unit Three: Network Reliability and Protection

- Optical layer protection schemes.
- Line and path protection.
- Sub-network connection protection.
- Network restoration and redundancy.
- Performance monitoring and SLA.
- Optical power levels.
- Signal-to-noise ratio (OSNR).

Unit Four: Troubleshooting and Operations

- Common optical network issues.
- Troubleshooting methodologies.
- Using test and measurement equipment.
- Fiber maintenance and repair.
- Optical power loss analysis.
- Dispersion management.
- Network management systems.

Unit Five: The Future of Optical Networks

- 400G and beyond technology.
- Software-Defined Networking (SDN) for optical.
- Photonic mesh networks.
- Quantum communications and optical networks.
- Leadership in network strategy.
- Career pathways in optical engineering.
- The future of high-speed transport.

FAQ:

Qualifications required for registering to this course?

There are no requirements.

How long is each daily session, and what is the total number of training hours for the course?

This training course spans five days, with daily sessions ranging between 4 to 5 hours, including breaks and interactive activities, bringing the total duration to 20 - 25 training hours.

Something to think about:

How can a deeper understanding of optical transport networks allow professionals to strategically leverage the vast bandwidth of fiber to not just meet but anticipate future data demands, driving new services and business models?

What unique qualities does this course offer compared to other courses?

This training course is unique because it provides a dedicated, strategic focus on the practical design and optimization of optical transport networks. While other programs may cover general fiber optics, our curriculum is designed to empower professionals with the specific skills needed to plan, deploy, and manage real-world OTN and DWDM infrastructure. The program is a hands-on experience, with exercises that directly simulate the challenges and decisions involved in a link budget calculation or a network protection design. We go beyond theoretical concepts to provide a clear, actionable roadmap for balancing business needs with the imperative of delivering seamless and high-quality user experience. This course is for professionals who want to lead their organizations toward a more efficient, high-performing, and future-proof network.
